

APPENDIX D

HAZARDOUS MATERIALS

APPENDIX D. HAZARDOUS MATERIALS

HAZARDOUS WASTE SCREENING STUDY

The Louis Berger Group, Inc. (Berger) was retained by the Lower Manhattan Development Corporation (LMDC) to perform a Hazardous Waste Screening (HWS) Study in support of the Generic Environmental Impact Statement (GEIS) for the proposed World Trade WTC Memorial and Redevelopment Plan (Proposed Action). The HWS Study was performed to assess the presence of hazardous materials within the Study Area that would impact, or be impacted by, the Proposed Action.

The Study Area is bound to the north by Murray Street, to the south by Carlisle/Thames Street, to the west by the Hudson River, and to the east by Broadway and includes the Project Area, comprised of the WTC Site, 130 Liberty Street, 140 Liberty Street, and Site 26. The WTC Site is bound to the north by Vesey Street, to the south by Liberty Street, to the west by West Street, and to the east by Church Street. The property located at 130 Liberty Street is bound to the north by Liberty Street, to the south by Albany Street, to west by Washington Street and to the east by Greenwich Street. The property located at 140 Liberty Street is bound to the north by Liberty Street, to the south by Cedar Street, to the west by Route 9A (West Street), and to the east by Washington Street. Site 26 is bound to the north by Murray Street, to the east by Route 9A, to the south by Vesey Street, and to the west by North End Avenue.

The HWS Study consisted of the following tasks:

- Review of Study Area history;
- Reconnaissance of the Study Area and review of existing conditions; and
- Review of Local, State, and Federal government records for sites located within the Study Area.

The historic events of September 11, 2001, may have resulted in unknown releases of petroleum and/or chemicals from building materials located at the WTC Site. Impacted soil and/or groundwater may be present in portions of the Project Area that are to proposed to be excavated. The presence of contamination in soil and/or groundwater has the potential to affect handling, management and disposal requirements. As a result of the events of September 11, 2001, it is likely that the 27,000 gallon combined capacity of petroleum storage tanks, present at the WTC Site ruptured, releasing their contents. It is expected that some quantity of fuel oil was consumed by fires, while the remaining quantity was removed during the subsequent rescue and recovery activities.

A review of Sanborn Fire Insurance Maps indicated that the eastern portion of the WTC Site was used by the Hudson and Manhattan Railroad lines. The railroad was constructed between 1894 and 1923 and was in existence until the WTC was constructed in the late 1960's. The use of the eastern portion of the WTC Site as a rail yard is of environmental concern since it is possible that petroleum products and other hazardous materials were used, stored, or disposed of in a manner inconsistent with present day regulations. Portions of the former railroad station remain in the eastern portion of the WTC Site. Lead based paint (LBP) and Asbestos Containing Material (ACM) may be present on these structures.

The regulatory database review indicated the presence of two (2) hazardous materials spills at or adjacent to the that may be potential RECs. One spill consists of an unknown quantity of dielectric fluid that was released at the intersection of Fulton and Church Street, potentially contaminating soil and groundwater in the vicinity of the WTC Site. The other spill consisted of approximately 10,000 gallons of fuel oil and 1,000 gallons of diesel fuel released from ruptured petroleum storage tanks formerly located at 130 Liberty Street, as a result of the events of September 11, 2001. The releases at this property may have resulted in petroleum-impacted soil and/or groundwater.

The regulatory database review indicated the presence of a spill of hazardous materials within the Study Area due to the events of September 11, 2001. The spill resulted in the release of more than 100,000 gallons of dielectric fluid from transformers and oil-filled electric feeders present in the former Con Edison substations located at 7 WTC, located north of the WTC Site.

It is recommended that further evaluation of the environmental concerns identified in the HWS Study be performed through performance of an Environmental Investigation, which includes the following tasks:

- *Geophysical Investigation* to identify subsurface utilities or structures that may be sources of contamination, migratory pathways for contamination and/or interfere with investigation or construction activities;
- *Surficial and Subsurface Soil Sampling and Analyses* to assess physical and chemical characteristics of fill and unconsolidated deposits throughout the Site and impacts from the events of September 11, 2001 and surrounding sites with potential sources of contamination;
- *Groundwater Sampling and Analyses* to assess physical and chemical characteristics of groundwater present within the Site for potential impacts by the events of September 11, 2001 and evaluation of surrounding sites with potential sources of contamination.
- *Sampling and Analyses* to assess chemical characteristics of material potentially deposited on structures located in the eastern portion of the WTC Site.

The findings of the Environmental Site Investigation will then be evaluated to assist in:

- Determining the need for, and extent of, construction health and safety measures to protect workers, the general public, and the environment from hazardous materials that may be encountered during the construction and operation of the Proposed Action.
- Developing procedures for managing and disposing of hazardous materials encountered during construction activities.

ENVIRONMENTAL SITE INVESTIGATION

The Louis Berger Group, Inc. (Berger) was retained by the Lower Manhattan Development Corporation (LMDC) to perform an Environmental Site Investigation (ESI) in support of the Generic Environmental Impact Statement (GEIS) for the proposed World Trade (WTC) Memorial and Redevelopment Plan (Proposed Action). The ESI was performed to assess the presence of hazardous materials within the Study Area that would impact, or be impacted by, the Proposed Action.

The ESI consisted of the following activities:

- *Geophysical Investigation* to identify subsurface utilities or structures that may be sources of contamination, migratory pathways for contamination and/or interfere with investigation or construction activities;
- *Surficial and Subsurface Soil Sampling and Analyses* to assess physical and chemical characteristics of fill and unconsolidated deposits throughout the Site and impacts from the events of September 11, 2001 and surrounding sites with potential sources of contamination;
- *Groundwater Sampling and Analyses* to assess physical and chemical characteristics of groundwater present within the Site for potential impacts by the events of September 11, 2001 and evaluation of surrounding sites with potential sources of contamination.
- *Sampling and Analyses* to assess chemical characteristics of material potentially deposited on structures located in the eastern portion of the WTC Site.

The ESI was performed in November and December, 2003. Nine (9) surficial or former grade soil samples were collected for laboratory analyses. Six (6) soil borings were advanced in areas that would be excavated as part of the Proposed Action. Three (3) soil borings were advanced within the eastern portion of the WTC Site; one (1) soil boring was located at 140 Liberty Street, within the area of the former St. Nicholas Church; one (1) soil boring was located adjacent to the Cedar Street right-of-way; and, one (1) soil boring was located at the intersection of Washington and Albany Streets. In total, twelve (12) subsurface soil samples were collected from the soil borings for laboratory analyses. Three (3) of the soil borings were converted to temporary groundwater well points and three (3) groundwater samples were collected for laboratory analyses. Fifteen (15) samples were collected from the surfaces of structures present in the eastern portion of the WTC Site.

SOILS

Eight (8) surficial/former grade soil samples were taken from the soil borings. Fill materials were encountered in the soil borings at depths ranging from approximately 15 to 65 feet below grade (ftbg). Soil representative of native deposits was noted beneath the fill materials. Field screening of the subsurface soils recovered during the ESI revealed no visual or olfactory evidence of contamination.

The ESI identified elevated concentrations of SVOC and metals in the surficial / former grade soil and fill material and elevated concentrations of metals in native soil. These materials are common in urban settings and are note anticipated to be the result of a release of hazardous materials; rather they are expected to reflect background concentrations. Based on the laboratory results, the excavated soils would be characterized as non-hazardous waste.

GROUNDWATER

Groundwater was encountered at depths of ranging from 6 to 45 ftbg. The laboratory results revealed the presence of elevated concentrations of volatile organic compounds (VOCs) typically associated with petroleum in the groundwater sampled at the intersection of Washington and Albany Streets. Elevated concentrations of the VOC tetrachloroethylene (Perc) were detected in groundwater samples collected at 130 Liberty Street. Perc is commonly associated with dry cleaning operations and its presence is likely associated with a nearby release. The detected concentrations of Perc would require pre-treatment to the effluent of dewatering operations prior to discharge. The concentrations of VOCs associated with petroleum would not require pre-treatment.

SURFACE SAMPLING

Fifteen (15) samples were collected from the surfaces of structures located in the eastern portion of the WTC Site to assess the presence of materials deposited as a result of the events of September 11. Four (4) samples were collected from the concrete foundation walls in the southeast corner of the WTC Site; seven (7) samples were collected from surfaces in the mezzanine in the eastern portion of the WTC Site; and, four (4) samples were collected from the generator pit.

The laboratory results indicated that elevated concentrations of asbestos and metals were present on the sampled surfaces. Based on the results of the investigation, cleaning of the surfaces of these structures is recommended prior to performing construction activities.

NOTES:

ug/kg - micrograms per kilogram

U - Analyte not detected at method detection level

NS - No Standard

MDL - Method Detection Limit

J - Analyte detected below the quantitation limits

*** - As per TAGM #4046, Total Semi-VOCs <500,000 ug/kg and Individual Semi-VOCs <50,000 ug/kg

B - Analyte detected in method blank

Shading - Detected concentration meets or exceeds TAGM RSCOs or USEPA HEAST Human Health Guidance Values

Bold results exceed TAGM RSCOsUnderlined results exceed USEPA HEAST Human Health Guidance Values
